G/L Account Line Item Browser (G/L View)

Use

The line item browser lets you browse through line item information quickly and efficiently.

Features

The line item browser always shows aggregated data. The level of aggregation or detail depends on the current layout.

You can change the layout to show the information you are interested in depending on the current context. If you have defined a layout you want to use again, you can save it and then apply it with a single click.

If you select one or several lines before changing or selecting a layout, the information in the selected lines is used as a restriction and the new layout is applied to this restricted set of data.

Selection

The line item browser supports restrictions for most FI document fields. For example, you could enter the search string ***1000*** (including the **'*'**) for the document line item text. The line item browser output would then only contain information from documents which have the phrase **1000** somewhere in the document line item text.

Integration

The line item browser is not a replacement for the respective line item report. The additional features of the line item report (e.g. correspondence, mass change, request correction) will not be made available in the line item browser. Please read Line Item Browsers: Differences to Line Item Reports for additional information.

You can call the respective line item report via the Report-Report-Interface to use additional features.
