G/L Account Line Item Display

Use

The report displays a list of the line items of the G/L accounts. You can display the line items for one or more G/L accounts in the following views:

- In the **general ledger view** for line item display, you can display the line items together with the general ledger account assignments (*General Ledger Line Items*) and G/L account line items or document data.
- In the **entry view** for line item display, you can display the G/L account line items (*G/L Account Line Items*).

The G/L account line items that were **only** posted to non-leading ledgers are **not** displayed in the **entry view**.

You can also display the items in a cross-company-code list.
In this list, you can change individual documents and multiple posted line items.

Features

Selection

- Search help:
  To restrict the selection of G/L accounts in greater detail, you can use *Selection Using Search Help*, which combines different input helps.
- *Status* pushbutton (only relevant for accounts managed on an open item basis):
  - Open items:
    Items that were posted up to the *key date* and that were cleared after the key date or have not yet been cleared. The system proposes the current date as key date. If the field is left empty, the system applies the current date by default. By back-dating the key date, you can include in your selection items that have been cleared in the meantime.
  - Cleared items:
    Items that are cleared at the current point in time. By specifying a *clearing date* and a *key date*, you can restrict the items selection further.
  - All items:
    Open and cleared items. In combination with a restriction of the *posting date*, you can select all items that were posted within the last 90 days, for example.
- In the **entry view**, you can select items using the *item type*. Normal items are ones that do not belong to any of the other types that can be selected.
- In the **general ledger view**, you can select the ledger from which the data for general ledger accounting is to be read.
- List output options:
  - Display variant:
    The variant of the *ABAP List Viewer* with which you want to generate the list. If this field is left empty, the system applies the standard variant 1SAP.
  - Maximum number of items:
    Once the maximum number has been reached, the system terminates the selection and displays the

list of items. If no maximum number is specified or if zero is specified, the selection is performed without a limit.

- You can use dynamic selections for master data, item data in the entry view, and, in the general ledger view, selections relating to the selected ledger.

List Layout

In the SAP standard variants, items are sorted and totaled by account and company code and separated by header information relating to the G/L account. Account blocks are used to group together open, cleared, and parked items, which are identified by status icons and totaled.

For items posted to specific ledger groups, you can display the ledger groups as well as sort and summarize the items by ledger group.

Actions in the List

Basic functions such as variant layout, totals, and sort are delivered as standard in the *ABAP List Viewer*. In addition to the delivered standard variants (which start with 1SAP), you can create other global and user-specific variants. For this, you can use the field selection in the FAGLPOSX structure, which also contains the additional **special fields** that you can define in Customizing for your documents.

You can also perform the following actions:

- Navigate to the document display
  In the display of posted documents, you can scroll through the line items without having to return to the list. Parked documents can only be displayed individually.
- Change documents
- Change multiple items
  For all selected posted items, you can replace the values in a selection of document fields. If the change **cannot** be performed for a document, you can call an error log for that item.
- Display account master record
- Display balances
- Layout for G/L account header information
  You can display a selection of fields from the G/L account master record together with other information. The layout can be saved with the list variant and modified to suit individual user requirements.

Note

In the general ledger view, the line items for the selected ledger are taken from a data merge between the document line items in the entry view and the document line items in the general ledger view. In the case of fields that exist in both views, the data in the general ledger view takes priority. However, fields are only transferred from the general ledger view to the fields in the entry view if they are active in the relevant ledger. If fields exist in the general ledger table group but are not active in the relevant ledger, they are transferred from the entry view.

In the data merge, amounts in the entry view are in some cases (such as cash discounts) distributed proportionately across the amounts in the general ledger view. This is necessary if, as a result of document splitting, a line item in the entry view has been split into multiple line items in the general ledger view. The proportionately distributed amounts in the entry view cannot then be used for reconciliation with account balances because the total of the cash discount amounts from the line items, for example, does not correspond

to the balance of the cash discount account as a result of the rounding differences.
